Basel**

## Dear colleagues

Despite the absence of robust prospective evidence, bladder-sparing strategies are increasingly pursued by patients after neoadjuvant therapy. How should patients choosing bladder-sparing strategies be evaluated, treated, and followed?

SWISS SPARE aims to connect the Swiss expert community, systematically capture expert opinions, and publish the resulting consensus. The initiative seeks to support both treating physicians and patients in well-established, evidence-based scenarios as well as in areas where evidence is still limited.

To this end, we are organizing an in-person national consensus meeting with the goal of developing a Swiss expert consensus on this topic. Predefined consensus questions prepared by the scientific committee will be circulated to all invited experts two weeks prior to the meeting and will be discussed and voted on during the meeting. While voting on the consensus questions will be restricted to designated experts, the meeting is intended to be informative in nature and will be open to all interested clinicians working in the field.

We would very much appreciate your participation in this initiative and your attendance at the in-person meeting on May 8<sup>th</sup>, 2026, in Basel. We are inviting selected experts in the field of urothelial carcinoma and would highly value your contribution, as well as that of any specialists within your clinic whom you may wish to recommend. If you are unable to attend personally, we would welcome a qualified delegate to ensure broad representation from across Switzerland.

Best regards

SWISS SPARE
